

Dose-response classes

Definitions (per subset; LRT then Wald contrasts)

Buffered KO differs from WT; Het $\approx$ WT — one copy suffices (recessive)

Linear Monotonic; Het & KO both differ, KO $\neq$ Het — true dose-grading

Haploinsufficient Het $\approx$ KO, both differ from WT — one copy already lost

Nonmonotonic Het and KO move in opposite directions

Insensitive No genotype effect (LRT n.s.)
